

Team 5 Code Pop

By Barrett Smith, Braden Peterson, Brayden Brimhall, Nathan Haight, Jordan Caldwell

Project Architecture And Tech

Frontend: JavaScript React, React Native

Backend: Python Django, Google Cloud, Docker, Google Maps, Stripe, Groq

Project Architecture: The project was split into two different front ends, with a shared backend running on a distributed system in Google Cloud. The first front end was the customer interface, which is a React Native mobile app where customers can place orders. The second front end were web-based dashboards for employees, where they can perform their specific tasks.

Credits

Front End Lead - Barrett Smith: Dashboard UI, app UI, user manual, Tonic

Back End Lead - Braden Peterson: Distributed system, cloud, automated CI tests, back end tests

Dashboard1 - Brayden Brimhall: Dummy data, repair staff and manger dashboard tests

Dashboard2 - Nathan Haight: Logistics, super admin, admin, dashboards, tests

API Lead - Jordan Caldwell: Stripe, geolocation, Grok, presentation slides

Biggest Challenge The Team Overcame

The biggest challenge we faced was getting the app to run consistently across everyone's operating systems. Because of this, overall development was frequently halted and slowed. This experience showed us that ensuring the application runs on all team members' machines needs to be treated as a prerequisite, not an afterthought, so development can proceed smoothly from the start.

Worst Technical Decision

The worst technical decision we made was trying to use the customer service AI from the previous team. They had very little documentation about the AI and it was a local model which only added complexity. We switched to Groq because they give a generous amount of free tokens.

Best Technical Decision

The best technical decision was splitting the app into two different frontends. One was the phone app for the customers and one was a web app that had the employee dashboards. Splitting the app helped with development by reducing the complexity of using react native and developing a good navigation flow for customers and employees. Splitting the app also created a better user experience for customers and employees.

The End

—
